

# Array Exercise 1 - Invoices

---

1. Create a console application called ArrayEx\_Invoices.a
  1. Create an array that will store 5 decimals.
  2. Prompt the user to enter 5 invoice totals. Add the invoice total they enter each time to the next element in the array.
  3. After the user enters the last invoice, use a for loop to iterate through the array and display the invoice totals. You should also calculate the sum of all the invoice totals and display that as well.
  4. Do the same thing you did in step 3 above, but this time use a foreach loop and display the average of the invoices instead of the grand total.
