Generic List Exercise

- Using the starter file and video provided:

- When the form is loaded, create an List with the following 5 values:

I

Love

Programming

So

Much

- When the display message button is clicked, access the elements from the List and display the message.

- When the reverse button is clicked, show the message in reverse order. (Do **not** use a backwards loop - there is a built in method you can use)

- Allow the user to add a value to the 2nd position of the List. Research the methods on the List class to figure out which method to use to do this. (2nd position when List is NOT in reverse order).

- When remove button is clicked, remove the second element. (second word)
